Concurrent Encryption Service on QNX

Sample report used as an example file for the demo.

Target: Raspberry Pi 4B, QNX SDP 8.0.3, 4 cores

Cipher: AES-256-CTR, one random IV per Data Block

Data Block limit: 2 MB; Worker Pool: 1 to 8 workers

How it works:

1. encclient splits a file into Data Blocks.
2. encserver splits each Data Block into Segments.
3. Workers encrypt Segments in parallel.
4. The Encrypted Block returns in a deferred reply.

If you can read this after decrypting, the round trip worked.
